

Lower 6 psychologists compare approaches

The Lower 6 psychologists have been learning about different psychological perspectives over the last term to see how explanations of human behaviour have evolved over time. From Wundt's development of the first psychological laboratory to more recent advancements in cognitive neuroscience and artificial intelligence, they have certainly developed their knowledge!

This week, it was time to put their understanding to the test, so each member of the class was allocated a different perspective and had to gather information that supported their own theory whilst discarding the views of other approaches.

The class showed excellent skills and supported each other through effective discussion of the key principles.

It was also lovely to hear their confidence growing as they begin to contrast ideas using the core debates and research methods within the subject.
