

Lower 4 pupils make pure sodium chloride salts

At the end of last term, Lower 4 pupils were tasked with the challenge of obtaining as much pure sodium chloride from a mixture of rock salt. Over the course of the two week half term break, the sodium chloride crystals have been forming (and growing!).

This week, the teams were asked to weigh how much salt they produced, and the winner received a treat. There was also a bonus prize for the team who produced the purest salt – this was determined by the colour.
