

## Lower 5 scientists focus on their cheek cells

The Lower 5 biologists have been learning about the topic of cells and the art of drawing accurate images of what they view down the microscope. They were exceptionally enthusiastic and loved the opportunity to see their own cheek cells as well as some other specimens. At one point we were even looking at a millipede under the stereoscopic microscope allowing pupils to observe the breathing apparatus of insects as well as the impressive mandible.

This practical forms one of many required practicals to meet GCSE standards. They were very careful learning the skills to ensure they are equipped with the techniques to answer examination questions successfully.
