

Lower 4 use an interactive board game to learn about plate tectonics

This term, the Lower 4 geographers have been delving into the fascinating realm of plate tectonics. So far, they have explored the Earth's structure and investigated the pioneering theory of continental drift, championed by Alfred Wegener.

To solidify their understanding, they participated in an interactive board game. During this activity, pupils tackled a variety of questions ranging from basic concepts such as the inner core, outer core, mantle, and crust, to more advanced topics including the formation of the supercontinent, Pangaea.

It was delightful to witness the pupil's enthusiasm and competitive spirit throughout the lesson, making it both enjoyable and educational.
