

## Lower 5 geographers play coastal Monopoly!

As any geographer will tell you, from caves, arches, stacks and stumps to headlands, wave cut platforms, beaches and sand dunes, there are a number of important coastal landforms worthy of discussion. It is therefore no surprise that the GCSE course covers an array of features formed by the processes of erosion and deposition.

Having covered each feature in our recent lessons, it was time for the Lower 5 geographers to put their knowledge to the test!

This was done with a variation of the traditional board game of Monopoly. Rather than buying up Bond Street or landing themselves in jail, however, there were questions on coastal landforms to be answered, picture cards to be revealed and, of course, chance cards.

Pupils could select from three levels of challenge to determine the difficulty of their question, earning themselves anywhere between one and three points per round.

This was a fun way to finish the theory of our coastal topic and revealed just how much the class had learned.
