

Learning about the chemistry of the Earth

Over the past few weeks, Lower 4 have been learning about the chemistry of the Earth and its atmosphere in their science lessons. They have studied the layers that make up the Earth and the composition of the atmosphere and more recently have been researching how the atmosphere is changing due to human activity. They have seen how burning fossil fuels and deforestation is affecting the levels of gases in the atmosphere and the consequences of this.

This has led on to discussions and research on natural disasters which have been attributed to climate change caused by global warming.

As part of their studies they made an origami 3D model Earth, as shown in the photos above.
