

Lower 6 psychology students learn how to be psychologists

Our Lower 6 psychologists have been getting to grips with the research methods topic. In psychology, research methods are all about how to be a psychologist and involve learning about the systematic procedures used to describe, predict, and explain behaviour and mental processes. The methods include experiments, questionnaires and interviews, case studies and observations to name a few! We have been finding out how to make sure that our data collection is robust, objective and reliable. This has also involved considering the difficulties associated with working with human participants.

Lessons have exposed students to opportunities to be participants in research themselves in addition to designing and conducting their own observational research and developing their understanding of experimental designs and sampling using jelly babies!
