

Lower 6 geographers get creative about hot spots

Our Lower 6 geographers have been busy learning about plate tectonic theory this term, covering ideas such as Wegener's theory of continental drift and Hess's research into seafloor spreading.

This week, it was the turn of Williams's hot spot theory so, to add a further element of excitement, the tables were turned, and the students became the teacher!

Each member was tasked with presenting the theory and a case study to the class in a creative and imaginative way. So, imagine my delight when, at the end of a PowerPoint presentation, Jamie went into a full rap about hot spots supported by Iris, his beatboxing partner, with Lydia providing a drum beat!

Very creative Lower 6!
